

SKI AND/OR BOARD CARRIAGE ASSEMBLY

ABSTRACT

[0052] The invention to which this application relates is an assembly for the attachment and movement thereby of skis, ski components and/or boards. The assembly comprises reception means which are provided with skids and/or wheels or rollers thereon to allow the said assembly to be moved across a surface, whether that surface be smooth, snow, road or the like. Also provided in the assembly are gripping means, said gripping means can be attached to the reception means, typically by elasticated cords and which gripping means are movable from a storage position with the reception means to an in-use position where the same are moved to a position remote from the reception means location on the skis to locate with a further portion, typically the bindings, of the skis. The assembly can be controlled via the gripping means to push or pull the assembly across the surface.
